The present invention describes primer sets for synthesising 5602 full-

CC (a) an oligo-dT primer and an oligonucleotide complementary to the

CC complementary strand of a polymucleotide which comprises one of the 5602

CC (a) an oligo-dT primer and an oligonucleotide which comprises one of the 5602

CC complementary strand of a polymucleotide which comprises one of the 5602

CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination

CC of an oligonucleotide comprising a sequence complementary to the

CC opplementary strand of a polymucleotide which comprises a 5'-end

CC sequence and an oligonucleotide comprising a sequence complementary to a

CC sequence and an oligonucleotide comprising a sequence of plynucleotide which comprises a 3'-end sequence of complementary to a

CC sequence and an oligonucleotide comprising a sequence of plynucleotide which comprises a 1'-end sequence', where the

CC sequence and an oligonucleotide comprising a selected from those defined in the

CC sequence of a polynucleotide of plynucleotides

CC particularly full-length cDNAs. The primers are also useful for the

CC particularly full-length cDNAs. The primers are also useful for the

CC particularly without any specialised methods. AAH13628 and

CDNAs easily without any specialised methods. AAH3362 to AAH13628 and

CC particularly condisoned sequences; and AAH13629 to AAH13628 represent

CC oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                    Yamamoto J;
                                                                                                                                                                                                                                                                                                                                                                                         Claim 8; SEQ ID NO 12354; 2537pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dry primer and an oligonuclectide complementary to the
complementary strand of a polynuclectide which comprises one of the 5602

(c) an oligonuclectide comprises at least 15 nuclectides; or (b) a combination

oligonuclectide comprising a sequence complementary to the
complementary strand of a polynuclectide which comprises a 5'-end

polynuclectide which comprises a 3'-end sequence complementary to a

complementary strand of a polynuclectide which comprises a 5'-end

polynuclectide which comprises a 3'-end sequence complementary to a

complementary strand of a polynuclectide since therefore the 5'-end sequence and an oligonuclectide comprises a 3'-end sequence complementary to a

complementary strand of a polynuclectide since therefore the 5'-end sequence is selected from those defined in the

complementary. The primer sets can be used in antisense therapy and in

comparing the 11-length cDNAs. The primers are also useful for the

complementary without any specialised methods. AAH13618 end

complementary without any specialised methods. AAH13618 to AAH13628

complementary and a primers allow obtaining of the full-length

complementary and a primers allow a AAH13629 to AAH13612 represent

complementary and an in of which are used in the exemplification of the

```

The present invention describes novel human proteins designated NOVX, where X is 1 to 20 e.g. NOV1. NOVX sequences can have neuroprotective, where X is 1 to 20 e.g. NOV1. NOVX sequences can have neuroprotective, where X is 1 to 20 e.g. NOV1. NOVX sequences can have neuroprotective, cytostatic, anticonvilsant, cerebroprotective, noticathritic, virucide, immunosuppressive, antiallaergic, antianaemic, antibacterial, fungicide, immunosuppressive, antiallaergic, antianaemic, antibacterial, fungicide, protozoacide and antihelminthic activities, and can be used in gene therapy. The NOVX proteins, nucleotides or antibodies can be used in the manufacture of a medicament for treating a syndrome associated with a human disease selected from NOVX-associated disorder, such as cancers (e.g. Leukaemia, lymphoma, menanoma or cancer of the liver, lung, muscle, covary, testis and uterus), neurological disorders (e.g. epilepsy, stroke, ischaemic cerebrovascular disease, Alzheimer's disease or Pick's diabetes mellitus, Grave's disease, or goitre), gastrointestinal disorders (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. ulcerative colitis, viral, bacterial, fungal, helminthic and protozoal infections. The NOVX proteins can be used as immunogens to produce antibodies and as vaccines. The NOVX nucleotide sequences may be biological samples (tissue typing), and in forensic identification of a biological sample. The present sequence encodes human NOVISC, which is ocated on chromosome 4

The present invention describes novel human proteins designated NOVX, where X is 1 to 20 e.g. NOVI. NOVX sequences can have neuroprotective, where X is 1 to 20 e.g. NOVI. NOVX sequences can have neuroprotective, cytostatic, anticonvulsant, cerebroprotective, noticopic, cardiovascular, antidiabetic, anticonvulsant, carebroprotective, noticopic, cardiovascular, immunosuppressive, antiallergic, antianthritic, virucide, protozoacide and antihelminthic activities, and can be used in gene the reapy. The NOVX proteins, nucleotides or antibodises can be used in the manufacture of a medicament for treating a syndrome associated with a concers convert disease selected from NOVX-associated disorder, such as cancers covery, testis and uterus), neurological disorder, such as cancers is schaemic cerebrovascular disease, Alzheimer's disease or Pick's disease, disorders of vesicular transport (e.g. cystic fibrosis, disease), disorders of vesicular transport (e.g. cystic fibrosis, disorders (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. ulcerativis), viral, bacterial, fungal, helminthic conduce antibodies and as veccines. The NOVX proteins can be used as immunogens to produce antibodies and as veccines. The NOVX proteins can be used as immunogens to biological sample. The present sequence encodes human NOVISG, which is

(CURA-) CURAGEN CORP.

WPI; 2002-732706/79. P-PSDB; ABP53587 New NOVX polypeptides and polynucleotides useful for treating NOVX-associated disorders, such as cancers, neurological disorders, disorders of vesicular transport, gastrointestinal disorders, and autoimmune diseases.

Claim 8; Page 114-117; 444pp; English.

The present invention describes novel human proteins designated NOVX, where X is 1 to 20 e.g. NOV1. NOVX sequences can have neuroprotective, where X is 1 to 20 e.g. NOV1. NOVX sequences can have neuroprotective, cyforetatic, anticonvulsant, cerebroprotective, noctropic, cardiovascular, antidiabetic, antidinalmantory, antithematic, antibacterial, fungicide, immunosuppressive, antianlengainthe activities, and can be used in gene comparation and antihemanished activities, and can be used in gene therapy. The NOVX proteins, nucleotides or antibodies can be used in the manufacture of a medicament for treating a syndrome associated with a conference of a medicamia, lymphoma, melanoma or cancer of the liver, lung, muscle, ovary, testis and uterus, neurological disorders (e.g. epilepsy, stroke, ischaemic cerebrovascular disease, Alzheimer's disease or pick's disease, disorders of vesicular transport (e.g. epilepsy, stroke, disease), disorders of vesicular transport (e.g. cystic fibrosis, disorders (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. ulceratives) viral, bacterial, fungal, helminthic conduce antibodies and as vaccines. The NOVX proteins can be used as immunogens to produce antibodies and as vaccines. The NOVX proteins can be used as immunogens to biological samples (tissue typing), and in forensic identification of a conduct on chromosome mapping, and in forensic identification of a located on chromosome apping, and in forensic identification of a located on chromosome and proteins equence encodes human NOVISD, which is

The present invention describes novel human proteins designated NOVX, where X is 1 to 20 e.g. NOVI. NOVX sequences can have neuroprotective, where X is 1 to 20 e.g. NOVI. NOVX sequences can have neuroprotective, cytostatic, anticonvulsant, cerebroprotective, nootropic, cardiovascular, cartidabetic, anticallergic, anticanamatic, anticarthritic, virucide, immunosuppressive, anticallergic, anticanaemic, anticarthritic, virucide, immunosuppressive, anticallergic, anticanaemic, anticarderial, fungicide, protozoacide and antihelminthic activities, and can be used in gene cerebrows. The NOVX proteins a cancers and can be used in the human disease selected from NOVX-associated disorder; such as cancers cerebrovascular, lymphoma, melanoma or cancer of the liver, lung, muscle, cerebrovascular disease, Alzheimer's disease or Pick's ischaemic cerebrovascular tisease, Alzheimer's disease or Pick's disease, disorders of vesicular transport (e.g. cystic fibrosis, disorders (e.g. ulcerative colitis, or gastric and duodenal disorders), autoimmune diseases (e.g. allergic reactions, autoimmune haemolytic anaemia, or rheumatoid arthritis), viral, bacterial, fungal, helminthic and protozoal infections. The NOVX proteins can be used as immunogens to produce antibodies and as vaccines. The NOVX mucleotide sequences may be biological samples (tissue typing), and in forensic identification of a biological sample the present sequence encodes human NOVISa, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               v VT, Spaderna SK, Gorman L;

The invention relates to isolated polynucleotides which are differentially-regulated in breast cancer. The methods and compositions of the present invention are useful for detecting, diagnosting, staging, monitoring, prognosticating, preventing and/or treating diseases and conditions relating to breast cancer, and may be used in gene therapy or clinical medicine and forensic medicine. Sequences given in records ACC72012-ACC72074 represent polynucleotides of the invention that are differentially-regulated in breast cancer. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human differentially-regulated breast cancer polynucleotide and polypeptide, useful for diagnosing, staging, prognosticating, preventing and/or treating diseases and conditions relating to breast

                                                                                            7564
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotides which are differentially-regulated in breast cancer. The methods and compositions of the present invention are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing and/or treating diseases and conditions relating to breast cancer, and may be used in gene therapy or allineal medicine and forensic medicine. Sequences given in records ACC72012-ACC72074 represent polynucleotides of the invention that are differentially-regulated in breast cancer. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description

Application US/09543681A

Patent NO. 6605709

GENERAL INFORMATION:
APPLICANT: GARY BRETON

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABIL

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TILE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT FILING DATE: 1999-04-09

PRIOR FILING DATE: 1999-04-09

PRIOR FILING DATE: 1999-04-09

NUMBER OF SEQ ID NOS: 8344

SEQ ID NO 548

LENGTH: 1650

and spiral ligament were removed and the sensory
epithelium was carefully dissected out of the modiolus.
Total RNA was extracted using the micro Fastrack kit
(catalog # K1593-02; Invitrogen, Carlsbad, CA), according
to manufacturer's instructions. Reverse transcription and
library construction were carried out with the Uni-Zap XR
Gigapack III Gold Cloning kit (catalog # 237612), both
from Stratagene (La Jolla, CA, USA), according to
manufacturer's instructions. Briefly: 15 ug mRNA was
reverse transcribed using a hybrid oligo(dT) linker-primer
primed with the linker- primer and transcribed using
Woloney murine laukemia virus reverse transcribed using
Woloney murine laukemia virus reverse transcribed using
Woloney murine laukemia virus reverse transcribed using
Woloney with the linker- primer and transcribed using
Woloney with DNA polymerase and RMSas H. Complementary
DNA was blunt ended with Ptb DNA polymerase, ligated with
ECOR I adapters in the presence of ligase and digested
with Xho I. The cDNA was sequentially size fractionated
over Pharmacia Size Sep400 (Chontech, Palo Alto, CA)
columns to enrich for cDNAs greater than 400bp and 1000
bp, respectively. The cDNA was then directionally ligated
to the Uni-ZAP KR vector, which had been predigested with
ECOR I and Xho I. The phagemid was packaged with Gigapak
III Gold and, upon tiration on XLI Blue MRF, cells, the
recombinants. Stratagene's Exhsaist Interference
resistance helber phage library was estimated to be 11,100,000 recombinants. Stratagene's Exassist interference resistance helper phage (catalogue # 211203) was adopted to rescue plasmid DNA from the phages. Upon plating of the rescued library, individual cDNA clones were selected and grown in 96-well, 2 ml growth plate. Plasmid DNA was purified from 200 ul of saturated culture with the ConcertS6 (TM) plasmid purification kit (Invitrogen, Carlsbad, CA) as instructed by the manufacturer. ESTS from the 5' end of the CDNA clones were generated with the universal M13 reverse primer (CAGGAAACAGCTATCACC) and 25% strength Bigbye terminator sequencing chemistry (Applied Blosystems, Foster City, CA). Sequencing reactions were performed on MJ Tetrad thermal cyclers (MJ Research, Waltham, MA), and analyzed on 3700 automated capillary sequencers using POP5 polymer (Applied Blosystems, Foster City, CA). The frequency distribution of the library is a follows: 72% of genes have 1 copy; 14.3% 2; 12% 3-10; 1.4% 11-50 and 0.1% 51-150. As to gene function, 45% of genes are present in GenBank and have know function, 33% have hits in GenBank, but do not have assigned function; 12% are uncharacterized BSTS and 20% are unidentified."

CF171639 MRNA linear EST 25-JUL-2003 B0845C10-5 NIA Mouse Newborn Kidney cDNA Library (Long 1) Mus musculus cDNA clone NIA:B0845C10 IMAGE:30471777 5', mRNA sequence.
methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to Not1 adapters, digested with BCORI, size-selected, and cloned into the Not1 and EcoRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1994) 191, except that a significantly longer reannealing hybridization was used."

/clone structed from limition independent clones. CDNA constructed from limilion independent clones. CDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with BCCRI size-selected, and cloned into the NotI and EcoRI compatible sites of a custom modified MCS of the pBluescript (XS+) vector. The library was normalized in 2 pBluescript (XS+) vector. The library was normalized in 2 pBluescript and Bonaldo et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reamnealing hybridization was used."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ThrGlnGluTrpAspAsnSerLysSerIleLeuGlyValGlnCysGluValGlnLysGln 130

Mus musculus 16 days neonate thymus cDNA, RIKEN full-length enriched library, clone:Al30060L24 product:odd Oz/ten-m homolog 1 DKOSOPhila), full insert sequence.

AK037897.1 GI:2633225
Pollowing this first strand reaction, double-stranded CDNA was blunted, ligated to NotI adapters, digested with EcoRI. size-selected, and cloned into the NotI and EcoRI compatible sites of a custom modified MCS of the DBLuescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PheGlnLeuHisAsnVallleProGlyTyrProLysProAspMetAspAlaMetGluPro 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LeuGlyValGlnCysGluValGlnLysGlnLeuLysAlaPheValThrLeuGluArgPhe 140
